

## Rail System for Moving and Emergency Vehicles

*(Non exhaust rail series EMNE)*

Sourcetec non-exhaust rail system series “EMNE” is specifically designed with a special pneumatic bladder for a quick unhindered release for moving and emergency vehicles. The pneumatic bladder slides onto the exhaust pipe of the vehicle, where a manual fill valve inflates the bladder for a 100% sealed fit.

As the vehicle leaves the station, the pneumatic bladder moves with the supporting hose and connection assembly along the rail. At a predetermined distance from the door threshold, a pneumatic switch mounted on the rail is activated to deflate the bladder, thus disconnecting the bladder immediately from the tail pipe as the vehicle exits the building.

Sourcetec EMNE system is comprised of the following:

- Heavy duty steel rack
- Suspension supports for ceiling mount or wall mount
- Flexible hose up to 600° F
- Balancer assembly mechanism
- Complete pneumatic assembly
- Automatic safety and speedcheck assembly
